## INTRODUCTION

THIS HANDBOOK describes an oscilloscope and accessories listed below:

OSCILLOSCOPE

CDU150-CT531/3 comprising:

- |                           |           |                  |
|---------------------------|-----------|------------------|
| 1 Oscilloscope            | D/GA80490 | 6625-99-223-1190 |
| 1 Mains Lead              |           |                  |
| 1 Plug (for single sweep) |           |                  |
| 1 Handbook                |           |                  |

ACCESSORIES, not included with the above:

D/GA80491 Panel Protection Cover and Accessories, including:	2 - Fuses 2A	A912423/17
	2 - Fuses 1A	KS92497/11
	3 - Fuses 500mA	KS92497/19
	1 - Fuse 250mA	KS92497/12
	1 - Viewing Hood	C73176
	1 - Polarized Viewer	C73127
	1 - Camera Adaptor Plate	C73100
	2 - 10:1 Probe Kits	C73166
	2 - 50Ω Terminations	A73167

OPTIONS

The undermentioned options can be supplied if specified at the time of ordering.

OPT.01            'B' Timebase 2ms/cm instead of 1ms/cm.

OPT.02            CRT with P7 Phosphor (Part No.B913054) instead of P31.

OPT.03            A mains lead (Part No.B73333) with American flat-pin moulded rubber plug instead of the standard lead.

- OPT.04 'B' Timebase, 100ms/cm instead of 10ms/cm
  - OPT.05 'B' Timebase additional 20ms/cm and 50ms/cm ranges
  - OPT.06 Front panel GATE OUT instead of SWEEP OUT
  - OPT.07 'B' Timebase 100ms/cm instead of 1μs/cm
  - OPT.08 'B' Timebase 20ms/cm instead of 10ms/cm
  - OPT.09 Variable 'B' sweep
  - OPT.10 Ch.1 ground position instead of cascade
- N.B. Only one timebase option can be supplied, but this may be combined with any other option(s) if required.

## CDU150 - CT531/3

## OSCILLOSCOPE

## SECTION 1

DATA SUMMARY AND CHARACTERISTICS

The CDU 150-CT531/3 is a solid-state general purpose oscilloscope featuring:

Bandwidth DC to 35MHz at 5mV/cm - dual channel  
 High brightness display (8 x 10cm)  
 Full delayed timebase with gated mode  
 Measuring accuracy,  $\pm 3\%$  'X' & 'Y' on all ranges.

VERTICAL DEFLECTION SYSTEM (two identical channels)

Sensitivity	5mV/cm to 20V/cm in 12 steps with 1-2-5 sequence. A variable gain control covers between steps and increases the range to 50V/cm
Bandwidth	D.C. to 35MHz (-3dB) A.C. 2Hz to 35MHz (-3dB) 0.2Hz to 35MHz (-3dB) with X10 probe.
Rise Time	10ns $\pm$ 2ns
Input impedance	1M $\Omega$ $\pm$ 10% shunted by 25pF $\pm$ 1pF.
Max. Input Voltage	$\pm$ 600V peak (combined D.C. & A.C.)
Measuring Accuracy	$\pm 3\%$
Display Modes	Channel 1 only Channel 2 only Channels 1 & 2 (alternate sweeps) Chopped (500KHz) nominal Channels 1 & 2 added algebraically (either channel may be inverted)

## DATA SUMMARY &amp; CHARACTERISTICS

Signal Delay Line	180ns nominal
Cascade	Channels 1 & 2 cascaded internally to give a sensitivity of 1mV/cm ( $\pm 3\%$ ). Bandwidth, 2.5Hz to 8MHz (-3dB)
X Y Mode	Channel 2 input and attenuator can be switched to provide calibrated 'X' amplifier sensitivities of 5mV/cm to 20V/cm, $\pm 3\%$ . Bandwidth D.C. to 3MHz (-3dB)
Internal Trigger	Normal, Channel 1 or channel 2
Invert Facility	Both channels

HORIZONTAL DEFLECTION SYSTEM

Timebase 'A' Sweep Range	0.1 $\mu$ s/cm to 1s/cm in 22 steps with 1-2-5 sequence. Accuracy $\pm 3\%$ . A variable control gives complete coverage and extends the range to 2.5s/cm. A front panel lamp indicates uncalibrated sweep rates.
Timebase 'B' Sweep Range	1.0 $\mu$ s/cm to 10ms/cm in decade steps. Accuracy $\pm 3\%$ . A ten-turn multiplier controls delay time to within $\pm 1\%$ of the selected range. Jitter better than 1 part in 20,000.
Timebase 'A' Sweep Modes	Auto, triggered or single shot (armed).
Timebase 'B' Sweep Modes	Triggered
X5 Magnifier	Increases all sweep speeds by a factor of 5; i.e. extends fastest sweep Timebase 'A' to 20ns/cm and Timebase 'B' to 0.2 $\mu$ s/cm. Overall timebase accuracy, with magnifier in use, $\pm 3\%$ . A front panel lamp indicates magnifier in operation.

CDU150-CT531/3  
OSCILLOSCOPE

DATA SUMMARY & CHARACTERISTICS

Timebase Modes	'A'  'A' brightens 'B'  'A' delayed by 'B'  'A' delayed by 'B' Gated. Separate slope switch and trigger level control incorporated.
Sweep Out	Timebase 'A' sawtooth, d.c. coupled; amplitude 10V minimum into 10KΩ.
Trigger Source	Internal, External or Line
Trigger Requirements	Internal: 2mm at D.C. rising to 1cm at 35MHz External: 200mV p-p at D.C. rising to 1V at 35MHz.
Trigger Level	Internal: positive or negative slope, variable over full 8cm C.R.T. display height. External: positive or negative slope, variable over +20V to -20V.
Trigger Coupling	A.C., A.C. with LF reject, or D.C.
Automatic Triggering	Timebase free runs to give bright display until a vertical signal of 1cm appears on C.R.T., timebase then triggers automatically.
X Amplifier	Sensitivities: 100mV/cm, 200mV/cm, 500mV/cm, 1V/cm and 5V/cm. Accuracy ± 3%. Input impedance: 1MΩ ± 1% shunted by 25pF Bandwidth: D.C. to 3MHz, or A.C. 2Hz to 3MHz
Cathode Ray Tube	Display area 8cm X 10cm. Single gun P.D.A tube with 12kV overall accelerating potential. Direct access to C.R.T. plates.

## DATA SUMMARY &amp; CHARACTERISTICS

Brightness Modulation	A.C. coupled and requires 10V for visible modulation of the trace.
Graticule	Illuminated, and light filter provided.
Beam Finder	Overrides brilliance, vertical and horizontal shift control to bring bright trace onto C.R.T. face.
Calibrator	1KHz square wave; amplitude 25mV and 250mV p-p. Accuracy (frequency and amplitude) $\pm 1\%$
Power Requirements	100V-120V $\pm 6\%$ or 200V-250V $\pm 6\%$ , 45 to 440Hz, consumption 110VA.
Size	10in (26cm) wide, 10 in (26cm) high, and 16in (41cm) deep overall, including protection lugs.
Weight	27lb (12.5kg) approx.
Environmental	Designed to meet REMC/20/FR Cat.3 Issue 4 (General Requirements for Joint Service Electronic and Electrical Test Equipment), i.e. relevant clauses for Defence Spec. DEF133 Working Temperature Range: - 10°C to +55°C Accuracy: $\pm 5\%$ at extremes of range, $\pm 3\%$ from +10°C to +30°C Storage Temperature Range: -40°C to +70°C.

OSCILLOSCOPE

CDU150-CT531/3

OSCILLOSCOPE

## SECTION 2

### DESCRIPTION OF CONTROLS

#### DUAL-CHANNEL VERTICAL DEFLECTION SYSTEM

The dual-channel vertical deflection system permits two waveforms of amplitude not greater than 600V to be displayed either singly or simultaneously. The input impedance is  $1M\Omega$  in parallel with  $25pF$ .

#### INPUTS

CH1	BNC connector for Channel 1 deflection signals, or Y axis deflection signals using X-Y mode.
CH2 (CASCADE)	BNC connector for Channel 2 deflection signals, X axis deflection signals using X-Y mode or the input when using CASCADE.

#### CONTROLS

##### INPUT (Coupling)

AC	couples the input via a capacitor, blocking any d.c. component present in the input signal.
DC	couples all components of the input signal to the input amplifier.
GROUND	grounds the input of CH2 input amplifier and disconnects the input signal
CASCADE	couples the output of CH2 preamplifier to CH1 input.

##### SENSITIVITY

determines the input amplitude required to give lcm vertical deflection providing the GAIN control is in the CAL position.

##### GAIN

Provides continuous adjustment of sensitivity between the calibrated positions of the SENSITIVITY switch.

## DESCRIPTION OF CONTROLS

CAL

Position of GAIN control which gives calibrated sensitivity.

SET GAIN

Screwdriver adjustment to align the amplifier gain with the SENSITIVITY setting.

POSITION

Controls the vertical position of the display

SET BALANCE

Screwdriver adjustment to minimize vertical shift of the display when the GAIN control is varied.

PULL TO INVERT

- |     |  |
|-----|--|
| In  | positive input gives upward deflection   |
| Out | positive input gives downward deflection |

CHANNEL MODE

- |         |   |
|---------|---|
| CH1     | Channel 1 input displayed   |
| CH2     | Channel 2 input displayed   |
| ALT     | Channel 1 and Channel 2 inputs displayed on alternate sweeps  |
| CHOPPED | Channel 1 and Channel 2 inputs displayed on the same sweep by switching between channels at approximately 500 kHz                                   |
| ADD     | the algebraic sum of Channel 1 and Channel 2 inputs is displayed. The algebraic difference is obtained by inverting either channel (PULL TO INVERT) |

TRIGGER SELECTOR

Selects the source of internal triggering; also selects the source of the X signal when using the X-Y mode.

## DESCRIPTION OF CONTROLS

CH1	horizontal sweep circuits triggered only from CH1
NORMAL	each sweep is triggered from the waveform it displays.
CH2 (XY)	horizontal sweep circuits triggered only from CH2 input signal.  <u>NOTE:</u> When using the X-Y mode, CH2 input is connected to the horizontal deflection amplifier.
<u>PROBE POWER</u>	provides power supplies for an active probe.

HORIZONTAL DEFLECTION SYSTEM

The horizontal deflection system is capable of producing two linear timebases, A and B. The main timebase A, is used either in the single timebase mode, or delayed by means of the other timebase B. Control settings determine whether the A timebase triggers immediately after the delay period or is primed (GATED) to trigger from the next input signal after the delay period. The unit also provides for internal or external triggering of the timebases together with single sweep operation of the A timebase. The horizontal deflection amplifier may also be used as the X axis for X-Y operation.

CONTROLS

FOCUS provides optimum display definition

ASTIG/PRESS FOR TRACE provides optimum display definition when used in conjunction with the FOCUS control.

PRESS FOR TRACE operates the beam finder switch and brings the display within the area of the graticule irrespective of the POSITION and BRILL controls and of the nature of the input signal.

## DESCRIPTION OF CONTROLS

<u>SCALE</u>	controls graticule illumination
<u>BRILL</u>	controls display brightness
<u>POWER ON/OFF</u>	switches power to the instrument (adjacent neon indicator).
<u>CALIBRATOR</u>	sockets provide 25mV and 250mV 1KHz square wave, accurate to $\pm 1\%$ amplitude and frequency for calibration purposes.
<u>POSITION</u>	concentric controls for coarse and fine adjustment of the horizontal position of the display
<u>A TIME/CM</u>	selects the sweep rate of the A timebase to give lcm of horizontal deflection, providing that the concentric variable control is in the CAL position. The variable control provides continuous adjustment of the A timebase sweep rate between the calibrated positions of the A TIME/CM switch. Pulling out the variable control increases the gain of the horizontal deflection amplifier 5 times increasing the sweep rates of the A or B timebases accordingly, and producing a corresponding increase in X axis sensitivity when operated in the X-Y mode.
<u>UNCAL Neon</u>	indicates that the A variable control is not in the CAL position.
<u>X5 MAG neon</u>	indicates that the horizontal deflection is 5 times magnified.
<u>B TIME/CM &amp; DELAY TIME</u>	selects the sweep rate of the B timebase and in conjunction with the DELAY MULTIPLIER, the delay time.

## DESCRIPTION OF CONTROLS

DELAY MULTIPLIER

provides variable sweep delay between 0.5 and 10.5 times the delay time indicated on the B TIME/CM & DELAY TIME switch.

socket provides the sawtooth waveform of the A timebase.

TRIGGER MODE

## X AMP

routes the internal or external X input signals to the horizontal deflection amplifier.

## AUTO

displays the A timebase as a free-running trace in the absence of a trigger signal. An internal trigger signal resulting from a vertical display of 1 cm or greater will trigger the A timebase at a preset level.

## TRIG

routes the internal or external trigger signals to either the A or B timebase as determined by the TIMEBASE MODE switch

## SINGLE SWEEP

permits a single sweep of the triggered A timebase. A further display cannot occur until the SINGLE SWEEP push button is operated, or a short-circuit applied remotely through the jack.

TRIGGER LEVEL

concentric with the TRIGGER MODE switch. A continuously variable control which determines the point on the trigger signal at which the A or B timebase is triggered.

TIMEBASE MODE

## A

horizontal deflection provided by the A timebase.

DESCRIPTION OF CONTROLS

A BRIGHTENS B

horizontal deflection provided by the B timebase, but having an intensified region on the display showing the position and duration of the A timebase (delayed sweep) with respect the B timebase (delaying sweep), its position being determined by the DELAY MULTIPLIER, and duration by A TIME/CM.

A DEL BY B

horizontal deflection provided by the A timebase (delayed sweep) represented by the intensified region of the previous setting.

GATED

horizontal deflection provided by the A timebase (delayed sweep) as for A DEL BY B, with the exception that the A timebase is triggered from the input signal waveform following the completion of the delay time.

GATED TRIGGER LEVEL

a continuously variable control which determines the point on the A timebase (delayed sweep) at which the timebase is triggered. With the GATED TRIGGER LEVEL pushed IN the timebase is triggered from a positive-going transition on the waveform, and with the control pulled OUT the timebase is triggered from a negative-going transition on the waveform.

EXT TRIGGER/X INPUT

BNC connector for external trigger or X input. Adjacent 3-position slider switch provides calibrated attenuation of the EXT TRIGGER input, and calibrated sensitivities for the X INPUT when used in the X-Y mode.

## DESCRIPTION OF CONTROLS

TRIGGER SOURCE

INT (XY)

selects the source of the trigger or X axis signal.

EXT

selects the internal trigger signal from the vertical display unit, or the CH2 output as the X axis when used in the X-Y mode (TRIGGER SELECTOR at CH2 - XY)

LINE

selects the external trigger signal or the X input from the EXT TRIGGER/X INPUT socket.

TRIGGER COUPLING

AC

selects the method of coupling the trigger or X signals.

AC LF REJ

input coupled via a capacitor, blocking any d.c. component present. A.C. response -3dB at 20Hz

DC

input coupled via a capacitor, blocking any d.c. component present. A.C. response -3dB at 1.6kHz

accepts all components of the input signal.

TRIGGER SLOPE

determines whether the timebase selected is triggered from a positive-going or negative-going transition of the trigger signal waveform.

SINGLE SWEEP

Push Button

used when operating the A timebase in the Single Sweep mode.

Neon

primes the A timebase to trigger from the next input signal.

Jack

indicates that the A timebase is primed. for remote operation, simulating the push-button operation.

## DESCRIPTION OF CONTROLS

<u>TOP LEFT HAND REAR CONTROLS</u>	(release chrome screw & lift hinged flap)
<u>GEOMETRY</u>	continuously variable control for overall orthogonal setting of the display.
<u>TRACE TWIST</u>	continuously variable control for aligning the display with the horizontal graduation of the graticule
<u>Y-PLATES INPUT</u>	direct connection to the C.R.T. Y plates. The input is applied to the Y PLATES sockets and the two-position slider switch set to EXT. For normal use set slider switch to INT.
<u>X-PLATES INPUT</u>	direct connection to the C.R.T. X plates. The input is applied to the X PLATES sockets and the two-position slider switch set to EXT. For normal use set slider switch to INT.
<u>Z MOD</u>	for intensity modulation of the display. The input is applied to the Z MOD sockets and the two-position alider switch set to EXT. For normal use set the slider switch to INT.
<u>TOP RIGHT HAND REAR CONTROLS</u>	(release chrome screw & lift hinged flap)
<u>VOLTAGE SELECTOR PANEL</u>	selects the line voltage operating range of the instrument. Line fuse is adjacent.

## OSCILLOSCOPE

## SECTION 3

OPERATION

CAUTION Before connecting the oscilloscope to the power supply check that the setting of the mains voltage selector (located at top right-hand rear) is correct for the available supply voltage.

Do not operate the instrument with ventilation holes obstructed. A 30 minute warm-up period should be allowed before using the instrument to its full specification.

Obtaining a Display

1. (1) Set front panel controls as follows: (Fig. 2.1)

CHANNEL MODE	CH2
TRIGGER SELECTOR	NORMAL
CH2 input	GROUND
A TIME/CM	1ms
A VARIABLE	CAL.
X5 MAG	IN (X1)
TRIGGER MODE	AUTO
TIMEBASE MODE	A
TRIGGER SOURCE	INT

- (2) Switch ON and allow at least 30 seconds warm up.
- (3) Press ASTIG control (PRESS FOR TRACE) and centralize the trace on the CRT using the CH2 POSITION and horizontal POSITION controls.
- (4) Release PRESS FOR TRACE control and adjust BRILLIANCE, FOCUS and ASTIG to obtain a well defined trace.

Single Channel Operation

2. The input signal may be applied to either CH1 or CH2 input socket and the associated front panel controls used.

If CH1 is used switch CHANNEL MODE to CH1 and TRIGGER SELECTOR to CH1 or NORMAL.

## OPERATION

If CH2 is used switch CHANNEL MODE to CH2 and TRIGGER SELECTOR to CH2 or NORMAL.

### Cascade Operation

3. Recommended only when sensitivities of 1mV/cm to 5mV/cm are required

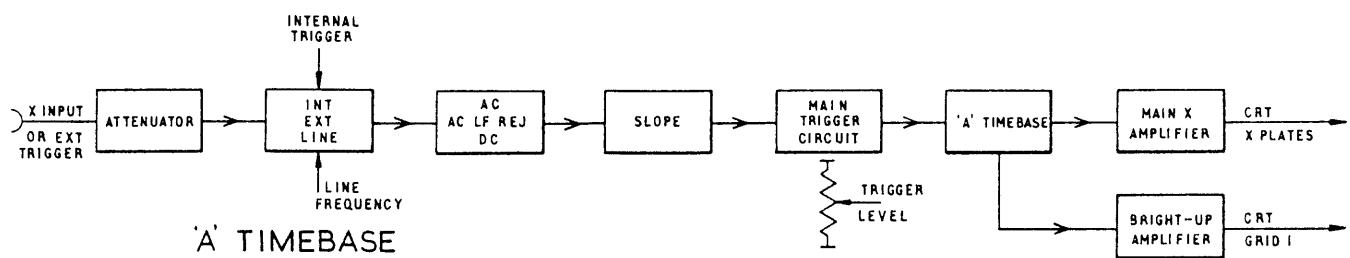

CH1 & CH2 SENSITIVITY	5mV/cm
CHANNEL MODE	CH1 (CH1 controls operative)
TRIGGER SELECTOR	CH1 or NORMAL
CH2 input coupling	AC or DC
CH1 input coupling	CASCADE

Apply the input signal to CH2 (CASCADE INPUT socket).

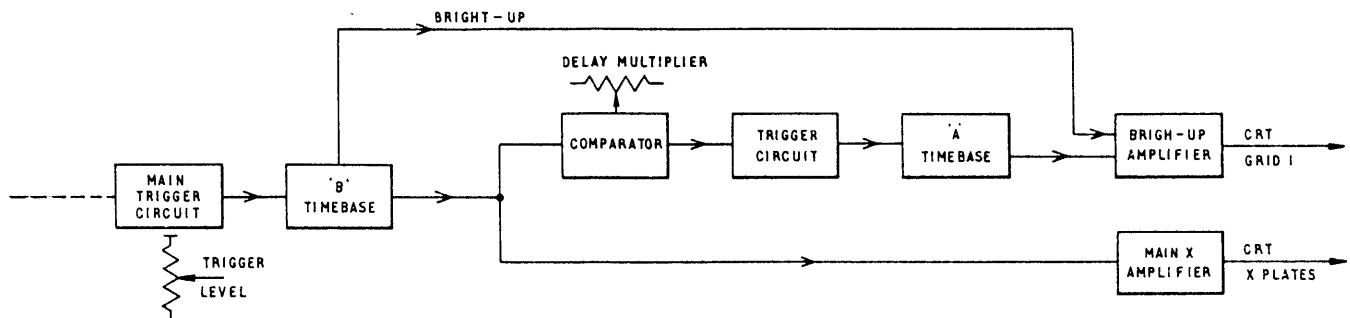

### Dual Channel Operation

4. NOTE: The displays may be viewed separately as for single trace operation.

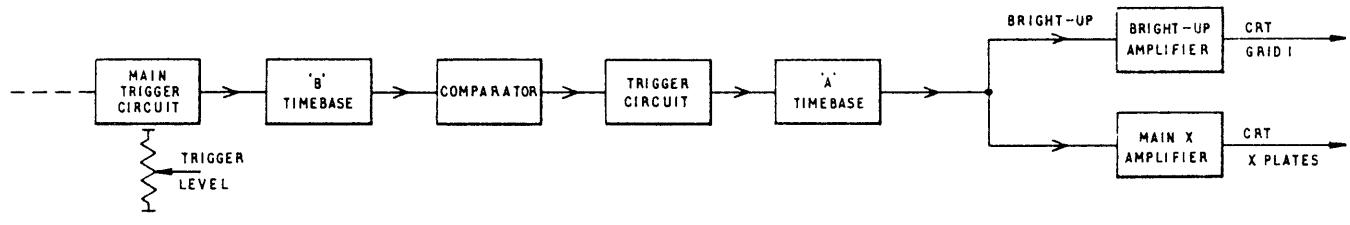

- (a) ALTERNATE: recommended for input frequencies above 10KHz.
- (1) Apply the two input signals to CH1 and CH2 INPUT sockets.
  - (2) Switch CHANNEL MODE to ALT
  - (3) If the two input signals are not synchronous switch TRIGGER SELECTOR to NORMAL.
  - (4) If the two input signals are synchronous, and it is desired to display them in their true time relationship switch TRIGGER selector to CH1 or CH2 as desired.
- (b) CHOPPED: recommended for input frequencies below 10KHz.
- (1) Apply the two input signals to CH1 and CH2 INPUT sockets.
  - (2) Switch CHANNEL MODE to CHOPPED

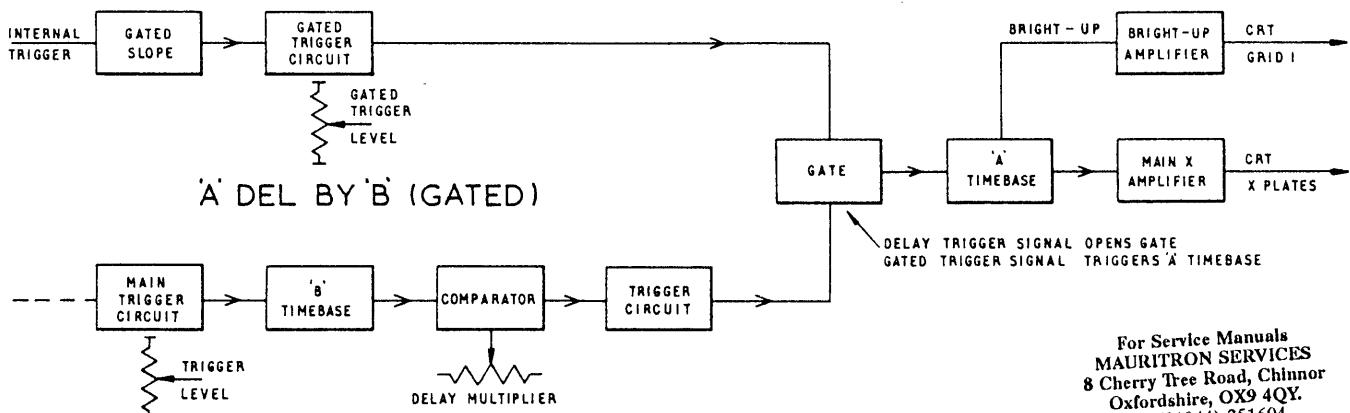

'A' TIMEBASE

'A' BRIGHTENS 'B'

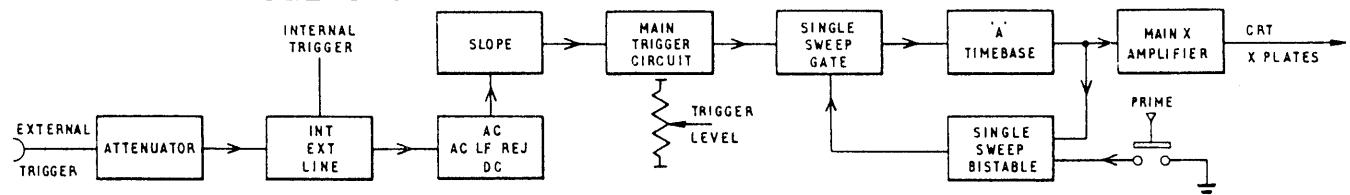

'A' DEL BY 'B'

'A' DEL BY 'B' (GATED)

Fax (01844) 352554  
email:- sales@mauritron.co.uk

SINGLE SWEEP

TIMEBASE MODES

FIG.3.2

## OPERATION

- (3) Switch TRIGGER SELECTOR to CH1 or CH2
- (c) ADD: suitable for synchronous signal inputs only.
- (1) Apply the two input signals to CH1 and CH2 input sockets.
- (2) Switch CHANNEL MODE to ADD
- (3) Push in INVERT switches on both channels.
- (4) TRIGGER SELECTOR may be at CH1, NORMAL or CH2
- (5) The algebraic sum of the two input signals will be displayed. To obtain the algebraic difference invert one channel.

Single Timebase Operation

5. (1) Apply the input signal(s) to CH1 and/or CH2 INPUT socket(s), and set controls for the desired mode of operation.
- (2) Switch TIMEBASE MODE to A and select the desired sweep rate on the A TIME/CM control.
- (3) Select the desired TRIGGER SOURCE, COUPLING and SLOPE.
- (4) Switch TRIGGER MODE to AUTO or TRIG.

NOTE: The TRIGGER LEVEL control is operative only when TRIG is selected.

Single Sweep Operation

6. (1) Set TRIGGER MODE to SINGLE SWEEP and other controls as for single timebase operation.
- (2) Operation of the SINGLE SWEEP push button results in one scan of the timebase, providing the TRIGGER LEVEL control is set correctly. But, if the button is operated when there is no input signal the A timebase is primed and the neon lamp glows. One scan of the A timebase will now be produced when an input signal is applied, providing the TRIGGER LEVEL control is set correctly.

## OPERATION

Delayed Sweep Operation

7. (1) Apply input signal to CH1 and/or CH2 INPUT socket(s) and set controls as desired.
- (2) Switch TIMEBASE MODE to A BRIGHTENS B
- (3) Switch B TIME/CM and DELAY TIME to the required range, and set the DELAY MULTIPLIER to give the required delay time.
- (4) Select the TRIGGER SOURCE, COUPLING and SLOPE for the delaying sweep (B timebase).
- (5) Switch TRIGGER MODE to TRIG and adjust TRIGGER LEVEL to trigger the B timebase.
- (6) Select the appropriate A TIME/CM range to determine the duration of the delayed sweep (A timebase) indicated by the brightened-up region of the display.
- (7) Switch TIMEBASE MODE to A DEL BY B to display the delayed sweep.

NOTE: To eliminate any jitter, switch TIMEBASE MODE to GATED and use the GATED TRIGGER LEVEL control in conjunction with the GATED SLOPE switch to trigger the delayed sweep.

X-Y Operation (using X INPUT socket)

8. (1) Apply the Y axis input signal to CH1 or CH2 and set controls as required.
- (2) Apply the X axis input signal to the X INPUT socket and select the desired X sensitivity on the adjacent switch.
- (3) Switch TRIGGER SOURCE to EXT and select the desired TRIGGER COUPLING.
- (4) Switch TRIGGER MODE to X AMP.

X-Y Operation (using CH2 as a pre-amplifier)

9. (1) Apply the Y axis input to CH1 and set the controls for single-

## OPERATION

channel operation, i.e. CHANNEL MODE to CH1.

- (2) Apply the X axis input to CH2 and switch TRIGGER SELECTOR to CH2 (XY).
- (3) Switch TRIGGER SOURCE to INT (XY) and select the desired TRIGGER COUPLING.
- (4) Switch TRIGGER MODE to X AMP.

### Operation of Z Mod (Intensity Mod).

10. (1) Set controls for vertical and horizontal deflection as required.
- (2) Raise the top, left-hand rear access panel and apply the intensity modulation signal to the Z MOD input sockets.
- (3) Switch the two-position Z MOD slider switch to EXT.

### Direct Connection to X & Y Plates

11. Raise the top, left-hand rear access panel and apply the input signal(s) to the X PLATES or Y PLATES as required, switch the appropriate two-position slider switch to EXT.

- NOTE:
- (1) X and Y POSITION controls remain operative
  - (2) Do NOT apply signals to CH1 or CH2 INPUT sockets whilst using direct access to X or Y plates.

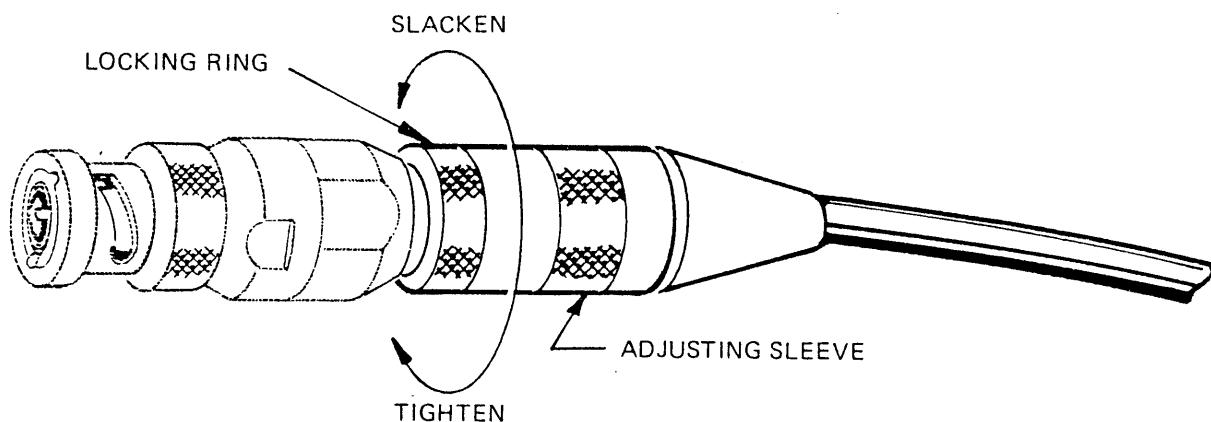

## PROBE COMPENSATION

Before using Passive Probe CPK 100 in the X10 condition, it is necessary to set up the compensation. This must be done every time the probe is transferred from one Oscilloscope to another.

Set the control as follows:

Y deflection	5mV/cm
Timebase	500 $\mu$ s/cm

Connect the probe tip to the 250mV output of the internal CALIBRATOR. Slacken the locking ring of the probe and turn the adjusting sleeve to obtain the best square-wave display without either overshoot or undershoot. Tighten the locking ring without moving the adjusting sleeve and recheck the waveform.

### PASSIVE PROBE CPK100 SPECIFICATION

ATTENUATOR RATIOS	X1 and X10
INPUT RESISTANCE	1M $\Omega$ on X1, and 10 M $\Omega$ on X10
INPUT CAPACITANCE	11pF (nominal) on X10
BANDWIDTH	D.C. to 50Mc/S min.
RISE TIME	7 us max.
OVERSHOOT	2% max.
MAX. INPUT VOLTAGE	600V peak (combined d.c. and a.c.)

CDU150-CT531/1

OSCILLOSCOPE

SECTION 4

MAINTENANCE

Calibration and Setting Up Procedure

This section assumes the oscilloscope to be in working order except for adjustments. Having worked through this section from page 4.2, providing each requirement of each instruction has been achieved, the oscilloscope will perform satisfactorily and meet its specification.

If any of these test requirements cannot be achieved, using the procedure given, this indicates that there is a circuit malfunction and further investigation is required.

Supplementary Checks

When used in conjunction with the above instructions, provide a means of checking that all circuits are functioning correctly, and that the equipment performs to its specification.

Waveforms

These are included to provide a ready means of verifying that all circuits are working correctly. It is essential that before observing waveforms that the calibration of the instrument is checked.

D.C. levels only are given for the vertical deflection system.

Dismantling

Advice on how to obtain access to P.C.Bs etc.

CALIBRATION AND SETTING-UP PROCEDURE

GENERAL

The instructions below assume an oscilloscope which is in working order except for adjustments. It is important that the procedure be followed in the order given.

Unless indicated to the contrary all instructions refer to the CDU 150 oscilloscope under test. The word 'Oscilloscope', when used refers to the Oscilloscope in the list of TEST GEAR below. Where in any paragraph a particular control is not mentioned, its position is unchanged from that last mentioned. Instructions to connect a test instrument to a point on the CDU 150 imply that the earthing lead of the instrument is to be connected to chassis as close as possible to the live lead.

TEST GEAR

The following list of test gear quotes suitable instruments. Other types may be used providing that their performance is adequate. In case of difficulty advice should be sought from

## ADJUSTMENTS

FIG.4. I

## OSCILLOSCOPE

Fast rise-time Pulse Generator	Cossor 1090 with 14 dB 75 Ω attenuator and 75 Ω termination
Square-wave Generator	Tektronix 106
Constant Amplitude Signal Generator	Tektronix 191
Time Mark Generator	Tektronix 184
LC Meter	Tektronix 130
2 off BNC - BNC leads	50Ω
1 off BNC - Tee-piece	50Ω
Crocodile clip-leads	
1 off 0.1 μF capacitor	2 kV d.c. working

PRELIMINARIES

Remove the covers as follows:- Remove four screws securing the back cover. Remove four screws securing the bottom cover. Slacken the screws securing the handle on top of the instrument and the screws securing the side trim. Ease out the two side covers.

Check that the mains voltage selector is adjusted to suit the available supply.

Connect mains lead switch POWER ON and allow a 15 minute warm-up period.

LV POWER SUPPLIES

Connect the Digital Voltmeter, negative to chassis and positive to PCM A as below. Adjust the controls to obtain the readings shown:

DVM Range	Connect to	Adjust Control	DVM Reading
200V	Pin 7	RV2	+120.0V
200V	Pin 15	RV3	+ 50.0V
20V	Pin 24	RV4	+ 12.6V
200V	Pin 33	RV5	- 50.0V

EHT SUPPLIES

**WARNING:** The oscilloscope under test MUST be switched off while the test gear is being connected and disconnected.

FOCUS	Fully counter-clockwise
BRILL	Fully clockwise
RV4 (SET BEAM CURRENT) on rear upright of chassis	Fully counter-clockwise

Connect AVO 8 set to 2500V d.c. range, neg. to TSD-3 on PCB B and pos. to chassis. Connect the electrostatic voltmeter between chassis and the junction of R37/B and C19/B on the rear panel of the instrument. Switch ON and adjust RV2 (SET EHT) on PCB B to obtain an indication of 1140V on the AVO. Check that the ESV reads between 8.8 and 11.2kV. Disconnect the AVO.

Connect the AVO, set to 2.5V d.c., neg. to TSD-3 and pos. to TSC-3 both on PCB B. WARNING: This AVO is 1.2kV from earth when connected. Adjust RV4/B (SET BEAM CURRENT) on left rear upright of chassis to obtain an indication of 0.4V on the AVO. Turn BRILL fully counter-clockwise and check that AVO reading falls to zero. Switch OFF and disconnect all testgear. Switch ON.

#### MEAN PLATE POTENTIALS

Set controls as follows:-

TRIG MODE	X AMP	X5MAG	IN (X1)
CHAN MODE	CH2	X,Y, and Z MOD INPUTS on PLATE SELECTOR board	INT
CH2 INPUT	GROUND		

Connect an AVO set to 100V d.c. range, across the X pins on the Plate Selector Board (top of instrument, left rear) and adjust X POSITION to obtain OV on the AVO. Disconnect negative lead of AVO and connect it to chassis. Adjust RV6 (SET MEAN PLATE POTENTIAL) on PCB F to obtain +60V on the AVO. Check that both X pins are between +59 and +61V. Disconnect the AVO.

Connect the AVO, set to 100V d.c. range, across the Y pins on the Plate Selector Board. Adjust CH2 POSITION control to obtain OV on the AVO. Disconnect the negative lead of the AVO and connect it to chassis. Adjust RV2 (SET MEAN PLATE POTENTIAL) on PCB G to obtain +60V on the AVO. Check that both Y pins are between +59V and +61V. Disconnect the AVO. Adjust BRILL, FOCUS and ASTIG controls to obtain a sharply defined spot.

## OSCILLOSCOPE

PRESETTING A AND B TIMEBASES

Set the controls as follows:-

TRIGGER MODE	TRIG
TIMEBASE MODE	A
TRIGGER LEVEL	Fully counter-clockwise
A TIME/CM	0.1 ms/cm
B TIME/CM	100 $\mu$ s/cm

Connect an AVO set to the 2.5V d.c. range, pos. to pin 29 on PCB E and neg. to chassis. Adjust RV4 (SET BIAS) on PCB E to obtain a reading of 1.1V. Disconnect the AVO.

Connect an AVO set to the 2.5V d.c. range, pos. to pin 30 on PCB E and neg. to chassis. Adjust RV1 (STABILITY) on PCB E to obtain a reading of 1.0V. Disconnect the AVO.

Set the AVO to the 2.5V d.c. range and connect it, pos. to pin 6 on PCB D and neg. to chassis. Adjust RV1 (STABILITY) on PCB D to obtain a reading of 1.0V. Disconnect the AVO.

X ATTENUATOR FREQUENCY COMPENSATION

Set the controls as follows:-

TRIGGER MODE	X AMP
TRIGGER SOURCE	EXT
X ATTENUATOR	1V/cm
TRIGGER COUPLING	DC

Connect the Oscilloscope, set to 50 mV/cm with a X10 probe ◀ (overall sensitivity 0.5V/cm) DC Coupled, to pin 3 on PCB C and chassis. ▶ Apply 2V p-p 1kHz square wave from the Bradley Calibrator to X INPUT and adjust C5 on PCB C to obtain optimum square wave response.

PRESETTING TRIGGER CIRCUIT

Set the controls as follows:-

X ATTENUATOR	0.5V/cm	A TIME/CM	0.1 ms
TRIGGER SOURCE	EXT	B TIME/CM	100 $\mu$ s
TRIGGER COUPLING	AC	TIMEBASE MODE	A
TRIGGER SLOPE	+VE	TRIGGER MODE	TRIG

Connect an AVO, set to the 2.5V d.c. range between pins 1 and 2 of PCB C. Adjust TRIGGER LEVEL to obtain a reading of OV.

Connect the Bradley Calibrator to X INPUT and set it to give a 1kHz square wave of 100mV p-p. Adjust RV3 (TRIGGER SLOPE BAL) on PCB C to obtain a stable trace on the CRT. Note the position of RV3.

Set SLOPE to -ve and readjust RV3 to obtain a stable trace. Note new position of RV3.

Set RV3 to a position midway between the two positions noted above, so that a trace is obtained whether SLOPE is set to +ve or -ve, ensuring that the AVO indication is maintained at OV. Disconnect the Calibrator and AVO.

#### TRACE TWIST

Set TRIGGER MODE to AUTO

Adjust RV6, TRACE TWIST on the Plate Selector Board to obtain a horizontal trace. If the range of adjustment is not enough, reverse the connections to RV6. See access instruction on page 4.33.

#### CH1 and CH2 INVERT BALANCE

Set the controls as follows:-

CHANNEL MODE	CH2	CH2 INVERT	IN
CH2 INPUT	GROUND	CH1 INPUT	DC
CH1 Var. GAIN	CAL	CH1 SENSITIVITY	5mV/cm
CH2 Var. GAIN	CAL	CH2 SENSITIVITY	5mV/cm
CH1 INVERT	IN	TRIGGER MODE	AUTO

Centre the trace on the CRT screen by means of CH2 POSITION control. Rotate CH2 variable GAIN control counter-clockwise and note any displacement of the trace. Adjust CH2 SET BALANCE so that the trace remains stationary during rotation of CH2 variable GAIN control.

NOTE: CH2 POSITION control may be used if necessary to keep the trace in the middle of the screen.

Pull out CH2 INVERT control and note any displacement of the trace. Adjust RV11 (INVERT BALANCE) on PCB H1 so that the trace remains in the same position whether the INVERT control is in or out.

Set CHANNEL MODE to CH1 and put a short-circuited BNC Plug in CH1 INPUT socket. Repeat the above procedure but using CH1 controls and RV4 (INVERT BALANCE) on PCB H1. Remove shorting plug and disconnect AVO.

## OSCILLOSCOPE

MESH AND GEOMETRY

Set the controls as follows:-

CHANNEL MODE	CH2	TIMEBASE MODE	A
CH2 INPUT	GROUND	A TIME/CM	0.1 ms
CH2 SENSITIVITY	5mV/cm	X5 MAG	In (X1)
TRIGGER MODE	AUTO	MESH	Fully clockwise

Adjust BRILL for a reasonably bright trace. Adjust FOCUS and ASTIG controls to obtain a sharply defined trace.

Set CH2 INPUT to AC and connect the Constant Amplitude Signal Generator to CH2 INPUT with a 1 MHz (approx) signal of level enough to obtain a vertical deflection of 6 cm p-p. Adjust RV8/B (GEOMETRY) on Plate Selector Board located at left rear of top of the instrument to obtain the optimum rectangular raster within the limits of the graticule.

Set CH2 INPUT to GROUND. Connect an AVO, set to the 100V d.c. range, pos. to the wiper of RV8/B (GEOMETRY) on the Plate Selector Board and neg. to the wiper of RV9 (MESH) on the left rear upright of framework. Adjust RV9 (MESH) for suppression of the background flare and check that the AVO reading does not exceed 40V.

MAIN Y AMP GAIN

Set the controls as follows:-

TRIGGER MODE	AUTO
TRIGGER SELECTOR	NORMAL
TIMEBASE MODE	A
CHANNEL MODE	CH2
CH1 & CH2 SENSITIVITY	5mV/cm
CH1 & CH2 INPUT	AC
CH1 & CH2 Var. GAIN	CAL

Connect the Oscilloscope with 10:1 probe and 10mV/cm on each channel, arranged to display difference between channels, one probe to pin 10 and the other pin 11 on PCB G. Apply a 1 kHz square wave to CH2 INPUT of amplitude enough to obtain 500mV (5 cm) p-p display on the Oscilloscope. Adjust RV1 (SET GAIN) on PCB G to obtain 6 cm p-p deflection on the instrument under test. Disconnect the Oscilloscope.

CH1 and CH2 GAIN

Set both CH1 and CH2 SET GAIN controls to approximately 60° from the clockwise end of their travel. Apply an input of exactly 25 mV p-p 1 kHz square wave from the Bradley Calibrator to CH2 INPUT. Adjust RV13 on PCB H1, CH2 PRESET GAIN, to give exactly 5 cm vertical deflection.

Apply the same input to CH1 INPUT and switch CHANNEL MODE to CH1. Adjust RV6 on PCB H1 to give exactly 5 cm vertical deflection. Disconnect the Calibrator.

TRIGGER LEVELS

Set the controls as follows:-

CHANNEL MODE	CH2	TRIGGER SELECTOR	NORMAL
CH2 INPUT	GROUND	A TIME/CM	0.1 ms
TRIGGER MODE	AUTO	CH1 INPUT	DC
(with s/c BNC plug in input socket)			
TIMEBASE MODE	A		

Set the Oscilloscope to 50mV/cm, DC coupled and free running timebase, d.c. zero set to middle of screen. Connect it with X10 probe to pin 4 of PCB C. Adjust CH2 position to bring the trace to middle of CRT of the instrument under test. Adjust RV3 on PCB G to bring the trace on the Oscilloscope to the middle of the screen, i.e. OV input.

Repeat the foregoing paragraph with the TRIGGER SELECTOR set to CH1 using RV5 on PCB H1 and CH2 using RV12 on PCB H1. Check that the voltage at pin 4 of PCB C remains within ± 2 mm as seen on the Oscilloscope with the TRIGGER SELECTOR switched to CH2, NORMAL or to CH1. Disconnect the Oscilloscope.

AUTO TRIGGER LEVEL

Set the controls as follows:-

TRIGGER MODE	AUTO	CHANNEL MODE	CH2
TRIGGER SOURCE	INT	CH2 INPUT	DC
TRIGGER COUPLING	AC	CH2 SENSITIVITY	5mV/cm

## OSCILLOSCOPE

TRIGGER SLOPE	+VE	CH2 Variable Gain	CAL
TRIGGER SELECTOR	CH2	CH2 INVERT	In
TIMEBASE MODE	A	A TIME/CM	0.2ms

With 4mV p-p 1kHz square wave to CH2 INPUT and adjust RV2 (AUTO PRESET) on PCB C to trigger the timebase half-way up the positive-going edge.

X AMP AND TIMEBASES

Set the controls as follows:-

TRIGGER SOURCE	INT	TIMEBASE MODE	A
TRIGGER MODE	AUTO	A TIME/CM	0.1 ms
SLOPE	+VE	A TIME UNCAL	CAL
CHANNEL MODE	CH2	B TIME/CM	100μs
CH2 INPUT	DC	X5 MAG	In (X1)

Connect the Oscilloscope using a 10:1 probe and sensitivity 0.5V/cm d.c. coupled to pin 15 on PCB E. Adjust RV5 on PCB E to obtain 13V p-p ramp on the oscilloscope. Disconnect oscilloscope.

Apply 100μs/div. marker pulses from the Calibrator to CH2 INPUT, and set CH2 SENSITIVITY to obtain approx. 2 cm vertical deflection. Switch TRIGGER MODE to TRIG and adjust TRIGGER LEVEL to obtain a stable trace. Adjust RV4 (X1 GAIN) on PCB F to obtain approx 11 cm horizontal trace.

Adjust RV3 (SWEEP CAL) on PCB E in conjunction with the horizontal POSITION control to align the second and tenth pulses with the second and tenth divisions respectively on the graticule.

Set A TIME/CM to 1 μs and the input to 1 μs/div. Adjust C11 on PCB E for 1 pulse/cm (2nd to 10th divisions on the graticule).

Check all timebase ranges adjusting RV3 and C11 as above to spread any errors and check that in no case does the error exceed ± 2 mm in 10 cm.

NOTE: C11 on PCB E is effective only on the 0.1μs/cm to 5μs/cm ranges.

With A TIME/CM set to 100μs and the input to 20μs/div., pull out X5MAG and adjust RV5 (X5GAIN) on PCB F for 1 pulse/cm (2nd to 10th divisions on the graticule).

Set the A TIME/CM to  $0.1\mu s$  and the input to 20ns/div. Rotate the X POSITION controls to observe the first ten pulses of the expanded trace. Ignore the first four pulses and adjust C5 on PCB F to obtain 1 pulse/cm from the fifth to the tenth divisions on the graticule. Push X5 MAG control in. Disconnect the Calibrator.

### B TIMEBASE

Set the controls as follows:-

TRIGGER MODE	TRIG
TIMEBASE MODE	A BRIGHTENS B
A TIME/CM	0.1 ms
B TIME/CM	1ms

Connect the Oscilloscope with 10:1 probe, sensitivity 0.5V/cm, DC coupled, to pin 13 on PCB D. Apply an input of  $0.2\mu s$ /div. from the Calibrator to CH2 INPUT, and adjust RV3 (SWEEP LENGTH) on PCB D to obtain 13V p-p ramp on the Oscilloscope. Disconnect oscilloscope.

Set B TIME/CM to 1 ms and the input to 1ms/div. Adjust RV2 (SWEEP CAL) on PCB D to align the second and tenth marker pulses with the second and tenth divisions respectively of the graticule.

Set B TIME/CM to  $1\mu s$  and the input to  $1\mu s$ /div. Adjust C6 on PCB D for 1 pulse/cm. (Second to tenth divisions).

Check all B TIME/CM ranges adjusting RV2 and C6 as above to spread any errors and check that in no case does the error exceed  $\pm 2\text{mm}$  in 10cm.

NOTE: C6 on PCB D is effective only on the  $1\mu s/\text{cm}$  range.

Set the DELAY MULTIPLIER to 5.0 on dial, B TIME/CM to  $100\mu s$  and A TIME/CM to  $10\mu s$ . Set the input from the Calibrator to  $100\mu s$  period, trigger the timebase by means of the TRIGGER LEVEL control, and adjust BRILL to show a brightened region approximately half-way along the trace.

Connect the Oscilloscope via a  $0.1\mu F$  2kV capacitor with a 10:1 probe, 1V/cm sensitivity (10V/cm overall) AC coupled, timebase 0.5ms/cm, to the junction of C2 and R9 at TSA2 on PCB B.

WARNING: TSA 2 is at -1290V with respect to earth.

## OSCILLOSCOPE

Adjust RV1 on PCB B to obtain a flat top response of the step waveform displayed on the Oscilloscope within  $\pm 1$  mm. Disconnect the Oscilloscope.

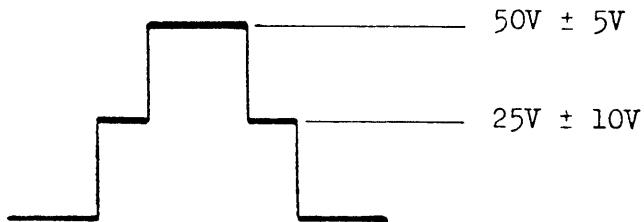

Fig.4.2 Waveform observed  
during adjustment of Timebase 'B'

#### DELAY CALIBRATION

Turn the DELAY MULTIPLIER control fully counter-clockwise. Check that dial reads 0.5. If not, loosen the knob and set it to 0.5. Set B TIME/CM to  $100\mu s$  and A TIME/CM to  $1\mu s$ . Set the Calibrator to give  $50\mu s$ /div. marker pulses and trigger the timebase by means of the TRIGGER LEVEL control.

Set the DELAY MULTIPLIER control to 10.5, adjust RV4 (SET MAX DELAY) on PCB D so that the brightened region just starts on the leading edge of the 22nd marker pulse. Turn DELAY MULTIPLIER to 0.5 and adjust RV5 (SET MIN DELAY) on PCB D so that the brightened region starts on the leading edge of the 2nd marker pulse.

Repeat the foregoing paragraph until both conditions are satisfied. Turn the DELAY MULTIPLIER so that the brightened region starts at the leading edge of the 11th pulse and check that the dial reads between 4.95 and 5.05.

CASCADE

CH 1 Var	CAL	TIMEBASE MODE	A
CH 1 SENSITIVITY	.5mV/cm	A TIME/CM	0.5 $\mu$ s
CH 1 INPUT	CASCADE	CHANNEL MODE	CH 1
CH 2 VAR	CAL	TRIGGER SELECTOR	NORMAL
CH 2 SENSITIVITY	5mV/cm	TRIGGER MODE	AUTO
CH 2 INPUT	AC	TRIGGER SOURCE	INT

Apply an input of 5mV p-p, 1kHz square wave from the Calibrator to CH 2 INPUT. Adjust RV14 on PCB H to obtain 5 cm p-p vertical deflection.

X - Y OPERATION

Set the controls as follows:-

CHANNEL MODE	CH2	TRIGGER SELECTOR	CH2 (XY)
CH 1 INPUT	AC	TRIGGER MODE	X AMP
CH 2 INPUT	DC	TRIGGER SOURCE	INT (XY)
CH 2 SENSITIVITY	5mV/cm	TRIGGER COUPLING	AC

Put the short-circuited BNC plug in CH 1 INPUT socket. Apply an input of 1 kHz square wave 20mV p-p to CH 2 INPUT from the Calibrator. Adjust RV4 (SET TRIG GAIN) on PCB G to obtain 4cm p-p horizontal deflection.

NOTE: Adjustment of RV4 results in a small d.c. shift at pin 4 of PCB C. Disconnect the calibrator, repeat the procedure described under the heading TRIGGER LEVELS on page 4.8.

Y AMPLIFIER, H.F. COMPENSATION

Set the controls as follows:-

CH1 INPUT	DC	CH2 INPUT	DC
CH1 SENSITIVITY	5mV/cm	CH2 SENSITIVITY	5mV/cm
CH1 Var. gain	CAL	CH2 Var. gain	CAL
CHANNEL MODE	CH 1	TIMEBASE MODE	A
TRIGGER SELECTOR	NORMAL	A TIME/CM	0.5 $\mu$ s
TRIGGER SOURCE	INT	TRIGGER MODE	AUTO
TRIGGER COUPLING	AC	TRIGGER SLOPE	+ve
		X5 MAG	In (x1)

## OSCILLOSCOPE

Ensure that the instrument has been switched on for at least half an hour.

Connect the Cossor 1090 Fast rise-time pulse generator via the 14dB attenuator and the 75 ohm termination to CH 2 INPUT and adjust the input level to obtain 6cm p-p on the CRT at approximately 1 MHz.

Pull out the X5 MAG control and adjust X POSITION to observe the second pulse. Adjust C47 & C48 on PCB H1 and C24 on PCB G to minimum capacitance, i.e. maximum undershoot. Adjust C25 and C26 in turn bringing up the leading edge while maintaining a level pulse top. Adjust C24 and C23 in turn to bring up the leading edge still further.

Push in the X5 MAG control and adjust C25 to obtain a level pulse top. Pull out X5 MAG control.

Set CH2 variable GAIN fully counter-clockwise and adjust C48 on PCB H1 (rear trimmer) to obtain the fastest rise time with minimal pulse irregularities and overshoot. Restore CH2 variable GAIN control to CAL. Bring up the leading edge with C47 on PCB H (front trimmer) in conjunction with C23 on PCB G.

Insert the input from the generator to obtain 8cm p-p display. Set A TIME/CM to 0.1μs and measure the 10% to 90% rise time. Verify that the rise time is between 8ns and 12ns (i.e. 4-6mm horizontal).

Disconnect the Cossor 1090, termination and attenuator from CH2 and connect the Constant Amplitude Signal Generator, set to a frequency of 50kHz, to CH2 INPUT. Set A TIME/CM to 0.1ms X5 MAG. control pushed in and adjust the input level to obtain 8cm p-p display. Increase the frequency till the amplitude of the displayed waveform falls to 5.6 cm. Check that the frequency is not less than 35 MHz. Disconnect the Signal Generator.

Set CHANNEL MODE to CH1, A TIME/CM to 0.5μs, with X5 MAG control pulled out. Apply an input from the Cossor 1090 to obtain a 6cm p-p vertical display. Adjust the X POSITION controls to observe the second pulse. Set CH1 Variable GAIN fully counter-clockwise and adjust C46 (rear trimmer) on PCB H1 for optimum pulse shape. Restore CH1 variable GAIN to CAL and adjust C45 (front trimmer) on PCB H1 for optimum pulse shape.

Ascertain the rise time and upper 3dB point, as detailed for CH2. If less than 35MHz it will be necessary to repeat the procedure, setting CH1 followed by CH2.

## OSCILLOSCOPE

ATTENUATORS, H.F. RESPONSE

Set the controls as follows:

CH 1 INPUT	DC	CH2 INPUT	DC
CH 1 SENSITIVITY	5mV/cm	CH 2 SENSITIVITY	5mV/cm
CH 1 Var. gain	CAL	CH 1 Var. gain	CAL
TRIGGER SELECTOR	NORMAL	TIMEBASE MODE	A
TRIGGER SOURCE	INT	A TIME/CM	1ms
TRIGGER COUPLING	AC	X5 MAG	IN (X1)
		TRIGGER MODE	TRIG
		TRIGGER SLOPE	+ve

Connect in Square Wave Generator to CH1 INPUT with or without the Capacitance Standardizer as detailed below the corresponding trimmers for optimum square wave response. Repeat for CH2 with the appropriate trimmers.

SENSITIVITY	TRIMMER CAPACITOR		ACTION
	CH1 (PCB J1)	CH2 (PCB J2)	
5mV/cm	C14	C28	Connect the LC Meter on 30 pF FSD range across INPUT socket and adjust for 25pF
10mV/cm	C12	C26	}
20mV/cm	C10	C24	
50mV/cm	C8	C22	
0.1V/cm	C13	C27	
0.2V/cm	C11	C25	
0.5V/cm	C5	C19	
5V/cm	C3	C16	
5V/cm	C9	C17	Disconnect input. Connect
0.5V/cm	C6	C20	LC Meter across INPUT
50mV/cm	C2	C23	socket and adjust for 25pF

CALIBRATOR

Set the controls as follows:

CH 1	AC	CH2 INPUT	AC
CH 1 SENSITIVITY	5mV/cm	CH2 SENSITIVITY	5mV/cm
CH 1 Var. gain	CAL	CH2 Var. gain	CAL
TRIGGER SELECTOR	CH2	CHANNEL MODE	CH1
TRIGGER SOURCE	INT	TRIGGER MODE	X AMP
TRIGGER COUPLING	AC		

Apply an input of 1kHz, 25mV p-p square wave from the Bradley Calibrator type 156 to CH2 input. Connect CH1 INPUT to the 25mV CALIBRATOR socket of the instrument under test. Check that the display is a 4 point Lissajou figure and adjust RVL (FREQ.ADJ.) on PCB F to obtain a beat frequency of less than 1 Hz.

SUPPLEMENTARY CHECKSGENERAL

The checks described in subsequent paragraphs will, in conjunction with the Calibration procedure described in Part 1 of this Section, prove the correct functioning of all circuits. The checks should be carried out in the order given. Where in any paragraph a control is not mentioned, its position is unchanged from that last mentioned.

TESTGEAR

The testgear called for in this Part is to be selected from the list in Part 1, Calibration.

CHECKS:-JITTER

Set the controls as follows:-

CHANNEL MODE	CH.2	TRIGGER SOURCE	EXT
CH2 INPUT	AC	TRIGGER SELECTOR	NORMAL
CH2 SENSITIVITY	0.5V/cm	TRIGGER MODE	TRIG
TIMEBASE MODE	A	TRIGGER COUPLING	AC
A TIME/CM	2μs	SLOPE	+ve
B TIME/CM	1ms	X5 MAG	In (X1)
DELAY MULTIPLIER	Fully clock- wise	Variable sweep	CAL

Using the Time Mark Generator apply 1ms/div time markers to CH2 INPUT socket and 10ms/div time markers to EXT TRIG socket simultaneously. Adjust TRIGGER LEVEL control to trigger the timebase. Set TIMEBASE MODE to A DEL BY B and rotate DELAY MULTIPLIER slowly counterclockwise until the leading edge of the first marker pulse

## OSCILLOSCOPE

appears at the centre of the screen. Pull out the X5 MAG control and verify that the horizontal jitter is not greater than 1 cm. Any sideways drift should be ignored.

CASCADE BANDWIDTH

Set the control as follows:

TIMEBASE MODES	A
CH1 & CH2 variable GAIN	CAL
CH1 & CH2 SENSITIVITY	5mV/cm
CH1 Input	CASCADE
CHANNEL MODE	CH1
TRIGGER MODE	AUTO
A TIME/CM	0.5ms
TRIGGER SOURCE	INT
X5 MAG	IN

Apply 5mV p-p 50 kHz sine wave from the Constant amplitude Signal Generator to CH2 INPUT and verify that the vertical deflection is 5cm. Increase the frequency and verify that the frequency at which the trace amplitude decreases to 3.5 cm (-3dB) is greater than 8MHz.

X AMPLIFIER BANDWIDTH

X ATTENUATOR	0.5V/cm	TRIGGER MODE	X AMP
CHANNEL MODE	CH2	TRIGGER SOURCE	EXT
CH2 INPUT	GROUND	TRIGGER COUPLING	AC

Apply 2.5V p-p 50 kHz sine wave from the Constant Amplitude Signal Generator to X INPUT and verify that the horizontal deflection is 5cm.

Increase the frequency and verify that frequency at which the horizontal deflection decreases to 3.5 cm is not less than 3MHz.

INTERNAL and GATED TRIGGER SENSITIVITY

TRIGGER MODE	AUTO	CHANNEL MODE	CH2
TRIGGER SOURCE	INT	CH2 INPUT	AC
TRIGGER COUPLING	AC	CH2 SENSITIVITY	5mV/cm
TRIGGER SLOPE	+ve	CH2 GAIN	CAL
TIMEBASE MODE	A	CH2 INVERT	In
A TIME/CM	10 $\mu$ s	TRIGGER SELECTOR	NORMAL
B TIME/CM	10 $\mu$ s	CH1 INPUT	AC

Apply an input of 40mV p-p 50kHz sine-wave from the Constant Amplitude Signal Generator to CH.2 INPUT socket. Switch TRIGGER MODE to TRIG, and by operation of the TRIGGER LEVEL control, verify that the timebase can be triggered by any part of the +ve-going slope of the displayed waveform. Set SLOPE to -ve and verify triggering from the -ve-going edge.

Set SLOPE to +ve and TIMEBASE MODE to A DEL BY B, and verify that rotation of the DELAY MULTIPLIER causes sideways movement of the displayed waveform. Switch TIMEBASE MODE to GATED, adjust GATED TRIGGER LEVEL control to verify that the timebase can be triggered from any part of the positive-going edge of the displayed waveform. Pull GATED TRIGGER LEVEL (NEG.SLOPE) and verify that the timebase can be triggered from any part of the negative-going edge of the displayed waveform. Rotate DELAY MULTIPLIER and note that there is no sideways movement of the waveform.

Set the controls as follows:-

TIMEBASE MODE	A
CH2 SENSITIVITY	50mV/cm
A TIME/CM	20μs
Input	10mV p-p

Verify that the waveform can be triggered satisfactorily from all parts of the displayed waveform. Set A TIME/CM to 0.1μs and pull out X5 MAG. Increase the input to 50mV p.p. 35MHz to give 1 cm p-p deflection satisfactorily and verify that the timebase can be triggered. Disconnect the input.

#### EXTERNAL TRIGGER SENSITIVITY

Set the controls as follows:-

X ATTENUATOR	0.5V/cm	SLOPE	+ve
TRIGGER SOURCE	EXT	TIMEBASE MODE	A
TRIGGER MODE	TRIG	A TIME/CM	0.1ms
TRIGGER COUPLING	DC	X5 MAG	IN

Apply an input of 200mV p-p 50kHz sine wave from the Constant Amplitude Signal Generator to the EXT TRIGGER socket and verify

## OSCILLOSCOPE

that the timebase can be triggered on +ve and -ve slope. Increase the input to 1V p-p and frequency to 35MHz and repeat the test.

LINE TRIGGER

Set the controls as follows:-

A TIME/CM	5ms	TRIGGER SELECTOR	NORMAL
TRIGGER SOURCE	LINE	CH2 INPUT	AC
TRIGGER MODE	TRIG	CHANNEL MODE	CH2

Connect CH2 input to a suitable source to supply an input voltage at mains frequency. Set CH2 SENSITIVITY to obtain 2cm p-p deflection, and verify that the timebase can be triggered on +ve and -ve slope.

CHANNEL MODES, ADD

CH1 & CH2 INPUT	DC	TRIGGER SELECTOR	NORMAL
CH1 & CH2 SENSITIVITY	5mV/cm	TRIGGER MODE	TRIG
CH1 & CH2 variable GAIN	CAL	TRIGGER SOURCE	INT
CH1 & CH2 INVERT	In	TRIGGER COUPLING	AC
CHANNEL MODE	ALT	A TIME/CM	1ms

Apply an input of 15mV p-p 1kHz square wave from the Calibrator to both channels simultaneously and adjust TRIGGER LEVEL control to trigger the timebase. Using the respective POSITION controls, place the CH1 trace above and CH2 trace below the horizontal centre-line and ensure that the amplitude of each waveform is 3 cm p-p.

Set the controls as follows in sequence and verify the results stated:-

CHANNEL MODE to ADD	Vertical deflection 6 cm p-p
CH1 INVERT pulled	Vertical deflection zero
CH2 INVERT pulled	Vertical deflection 6 cm p-p
CH1 INVERT restored	Vertical deflection zero
CH2 INVERT restored	Vertical deflection 6 cm p-p

CHANNEL MODE, ALTERNATE

CH1 INPUT	DC	A TIME/CM	0.5ms/cm
CH2 INPUT	GROUND	TRIGGER MODE	AUTO
TIMEBASE MODE	A	CHANNEL MODE	ALT

Put a short-circuited BNC plug into CH1 INPUT socket.

Adjust CH1 and CH2 POSITION controls to separate the traces approximately 3cm. Set A TIME/CM to 20ms and verify that the traces appear alternately. Set A TIME/CM to 0.1ms and verify that 3cm vertical shift of CH1 (using CH1 POSITION control) produces not more than 1 mm of vertical shift of the CH2 trace, and vice versa.

CHANNEL MODE, CHOPPED

Set the controls as follows:-

CHANNEL MODE	CHOPPED
TRIGGER MODE	TRIG
A TIME/CM	1μs

Adjust TRIGGER LEVEL control to trigger the timebase.

Verify that the frequency of the displayed waveform is between 400kHz and 600kHz and that there is no visible vertical edge at maximum BRILL.

SINGLE SWEEP

Set the controls as follows:-

CHANNEL MODE	CH2	A TIME/CM	0.1sec
CH2 SENSITIVITY	5mV/cm	X5 MAG	In(X1)
CH2 INPUT	AC	TRIGGER MODE	TRIG
TRIGGER SELECTOR	NORMAL	TRIGGER SOURCE	INT
TIMEBASE MODE	A	TRIGGER COUPLING	AC

Apply an input of 10mV p-p 1kHz square wave from the Calibrator to CH2 INPUT, and adjust TRIGGER LEVEL to trigger the timebase. Switch TRIGGER MODE to SINGLE SWEEP. The trace should disappear. Press the SINGLE SWEEP pushbutton and check that a single sweep of the timebase appears. Using the plug supplied, check that a single sweep occurs when the SINGLE SWEEP jack is short-circuited.

Set CH2 INPUT to GROUND. Press the SINGLE SWEEP pushbutton and check that the SINGLE SWEEP indicator lamp glows. Switch CH2 INPUT

## OSCILLOSCOPE

to AC and check that a single sweep of the timebase occurs and that the SINGLE SWEEP lamp is extinguished. Disconnect the input from CH2.

Beamfinder PRESS FOR TRACE

Set the controls as follows:-

TRIGGER MODE	AUTO
--------------	------

Obtain a trace at the centre of the screen. Turn the BRILL control fully counter-clockwise, and operate the PRESS FOR TRACE button (concentric with ASTIG) and hold it in. Check that the trace reappears at full brilliance. Release the button and adjust BRILL to normal level. Release PRESS FOR TRACE

Push PRESS FOR TRACE and hold in. Check that the trace cannot be moved off the graticule by operation of the CH2 and X position controls.

EXT X & Y INPUTS

Set the controls as follows:-

TRIGGER MODE	X AMP
CH2 INPUT	GROUND
X and Y plate*	EXT switches

\*Under hinged panel at rear top of the instrument.

By means of CH2 and X position controls bring the spot to the centre of the graticule. Apply an input of 30V p-p square wave between each Y plate socket and chassis in turn and check that the p-p vertical deflection is between 5 and 7 cm in each case.

Apply the same input to the X plate sockets in turn and check that the horizontal deflection is between 2.4 and 3.6 cm in each case. Restore the plate switches to INT.

Z MODULATION

Set the controls as follows:-

CH2 SENSITIVITY	5V/cm	A TIME/CM	2 $\mu$ s
CH2 INPUT	AC	TRIGGER MODE	TRIG

Using a tee-piece, apply an input of 100kHz square wave from the Square Wave Generator set to high output and terminated in  $50\ \Omega$  to CH2 INPUT and Z1 simultaneously. Adjust TRIGGER LEVEL control to trigger the timebase, and adjust the input to give a vertical deflection of approximately 2 cm p-p. Set the Z-MOD switch to EXT and check that the horizontal parts of the displayed waveform are extinguished, adjusting the BRILL control as necessary. Disconnect both inputs and restore the Z-MOD switch to INT.

SWEET OUT

Set the controls as follows:-

TRIGGER MODE	AUTO
TIMEBASE MODE	A

Connect a  $10k\ \Omega$  5% resistor from the SWEET OUT socket to chassis. Connect an oscilloscope with X10 probe, 0.5V/cm sensitivity, d.c. coupled, -ve slope across this resistor and check that on all A TIME/CM ranges of the CDU150-CT531/3 timebase, a ramp, of at least 10V (2cm) is displayed on the oscilloscope

WAVEFORMSConditions of Test

The tests described below will demonstrate the correct functioning of all parts of the circuit, but only if they are carried out in the order given, commencing on page 4.23 and working through the section to page 4.38.

All the oscillograms are taken from an oscilloscope used as test gear, not from the CDU150-CT531/3 under test; in every case d.c. zero is on the horizontal centre line of the oscillogram. Controls designated in CAPITALS are those of the CDU150-CT531/3 under test.

Control settings of both the CDU150-CT531/3 and the oscilloscope should remain unaltered between tests, unless explicit instructions are given to the contrary.

L.V. Power supply

(1) Ensure that the CDU150 is switched OFF. Connect it to a 50 Hz or 60 Hz supply variable between 210 and 250V. Set the Voltage Selector to 230V and adjust the supply to 230V. Remove FS4 on PCB A. Unsolder the two leads from pin 8 on PCB B, but leave them connected together and temporarily insulate the joint. Short-circuit C2 on PCB F. Switch ON.

(2) Using a digital voltmeter, check the supply voltages with respect to chassis as follows:-

PCB A, pin	Voltage
7	+120
15	+ 50
24	+ 12.6
33	- 50

(3) Using an oscilloscope with X1 probe, sensitivity 5mV/cm, a.c. coupled, timebase 10ms/cm, check 100 Hz ripple as follows:-

Test Point	Max. 100 Hz ripple
PBC A - 7	10 mV p-p
- 15	2 mV p-p
- 24	2 mV p-p
- 33	5 mV p-p

(4) Using the oscilloscope as in (3) above, and the DVM, vary the supply voltage over the range 214 - 246V and check the following:-

Test Points	DVM limits	Max. 100 Hz ripple
PCB A - 7	119.7 - 120.3	15 mV p-p
- 15	49.88- 50.12	3 mV p-p
- 24	12.57- 12.63	3 mV p-p
- 33	49.88- 50.12	7.5 mV p-p

(5) Switch power OFF, replace FS4 on PCB A, restore leads to pin 8 on PCB B and remove the shorting link from C2 on PCB F.

#### EHT Supply

Connect an AVO 8 set to the 2500V range, -ve to TSD/3 on PCB B, +ve to chassis. Connect an electrostatic voltmeter capable of indicating 15kV between the junction of R37 & C19 (circuit B) and chassis. Switch ON.

(1) Vary the BRILL control over its whole range and check that the AVO reading remains between 1140V and 1155V, and that of the ESV varies by not more than 10% of its reading at minimum brilliance. Restore the BRILL control to minimum brilliance immediately, switch off and disconnect both voltmeters.

(2) Connect an oscilloscope as follows and observe the oscillogram.

Pin 1 on PCB D

Oscilloscope  
set to:-

0.2V/cm

+ve slope

22

### Auto Trigger

Set the controls as follows:-

TIMEBASE MODE A

TRIGGER MODE AUTO

Oscilloscope  
connected to:-

Pin 18 on PCB D

Oscilloscope  
set to:-

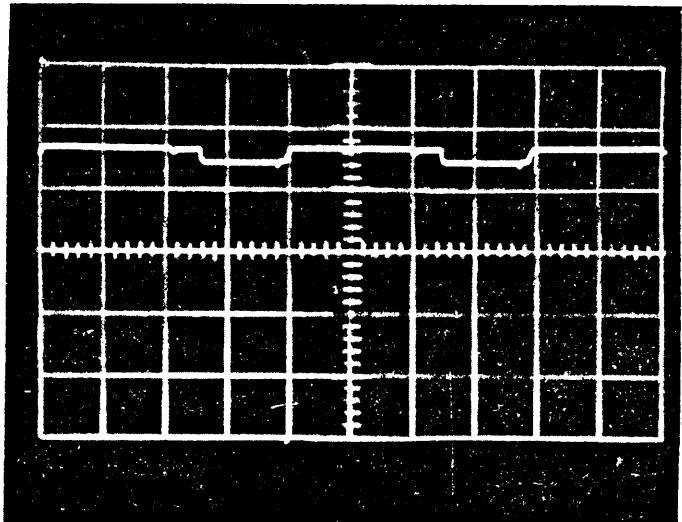

0.2V/cm

5 $\mu$ s/cm

+ve slope

Check that oscillogram No.8  
is repeated.

Pin 19 on PCB D

23

Remove input to CDU150-CT531/3 and check that a d.c. level of -1V is displayed on the oscilloscope.

Gated

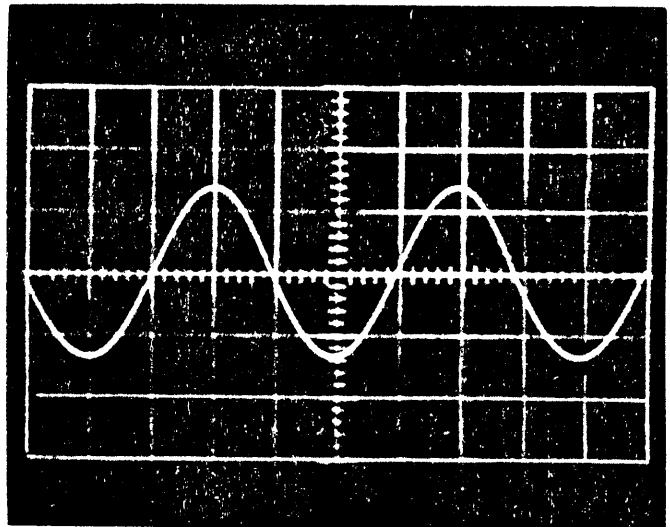

Set the controls as follows:-

CH2 INPUT	AC	TRIGGER SOURCE	INT
CH2 SENSITIVITY	0.2V/cm	SLOPE	+VE
CHANNEL MODE	CH2	GATED SLOPE	+VE (In)
TRIGGER SELECTOR	NORMAL	TIMEBASE MODE	A
TRIGGER MODE	TRIG	A TIME/CM	5 $\mu$ s

Transfer the 1V p-p 50kHz input to CH2 INPUT. Adjust TRIGGER LEVEL to trigger the timebase. Set TIMEBASE MODE to GATED and rotate GATED TRIGGER LEVEL to trigger the timebase halfway up the +ve-going slope. Centre the trace using the CH2 POSITION control.

Oscilloscope  
connected to:-  
Pin 15 on PCB C

Oscilloscope  
set to:-  
(CH2)  
0.1V/cm

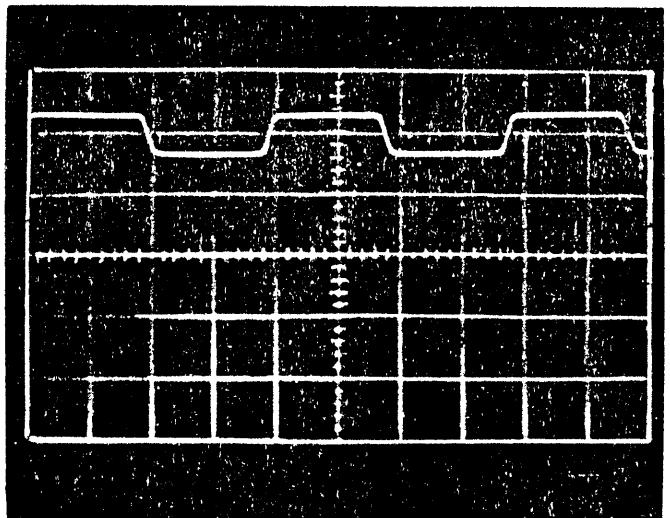

24

Switch TRIGGER SELECTOR to CH2. Oscilloscope display should remain stationary independant of CH2 POSITION control.

Oscilloscope  
connected to:-  
TR15 collector  
on PCB C

Oscilloscope  
set to:-  
0.5V/cm

25

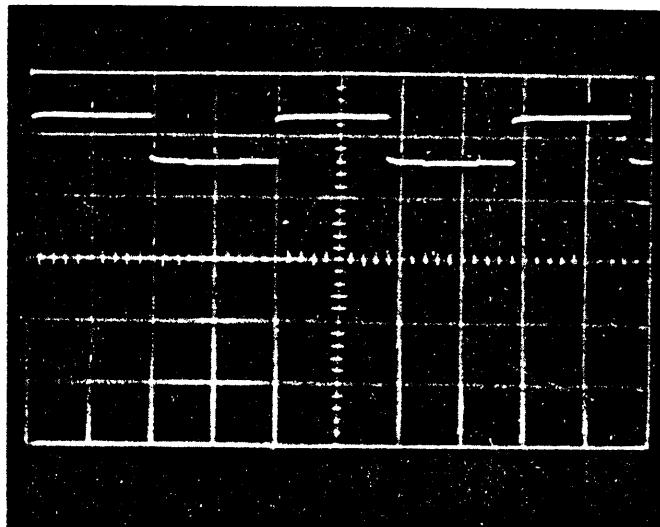

Oscilloscope connected to:-

TR21 collector  
on PCB C

Oscilloscope set to:-

0.5V/cm

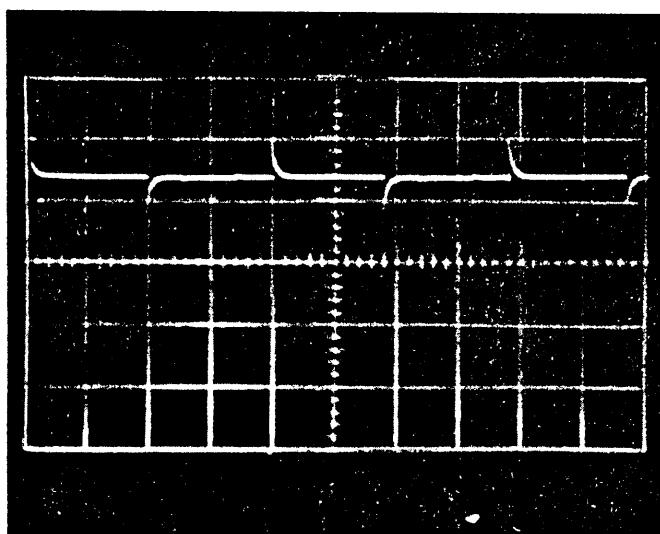

26

Oscilloscope connected to:-

Pin 20 on PCB C

27

### Chopped

Set the controls as follows:-

TIMEBASE MODE A

CHANNEL MODE CHOP

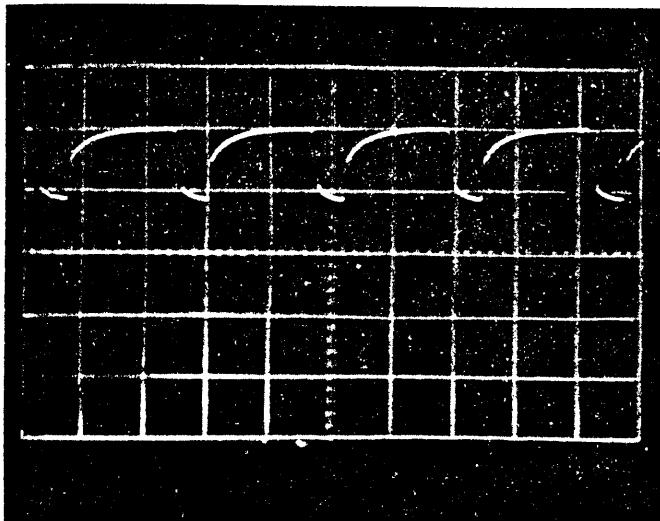

Oscilloscope connected to:-

PCB H2  
TR32 collector

Oscilloscope set to:-

0.5V/cm  
0.5 $\mu$ s/cm  
-ve slope

28

OSCILLOSCOPE

Oscilloscope  
connected to:-

PCB H2

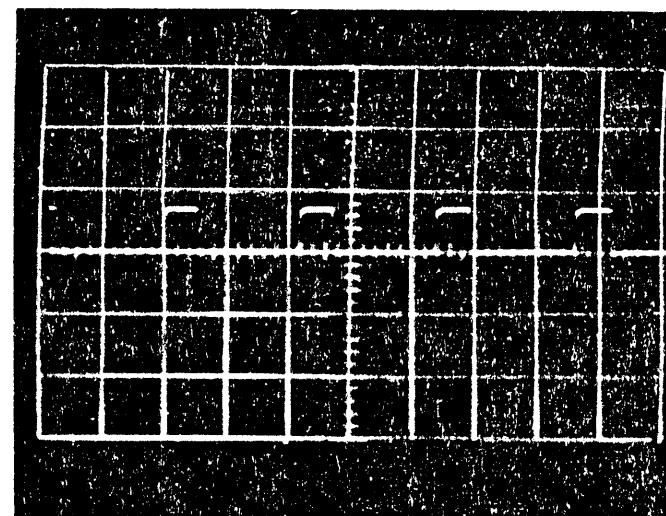

TR34 collector

Oscilloscope  
set to:-

0.5V/cm

0.5 $\mu$ s/cm

-ve slope

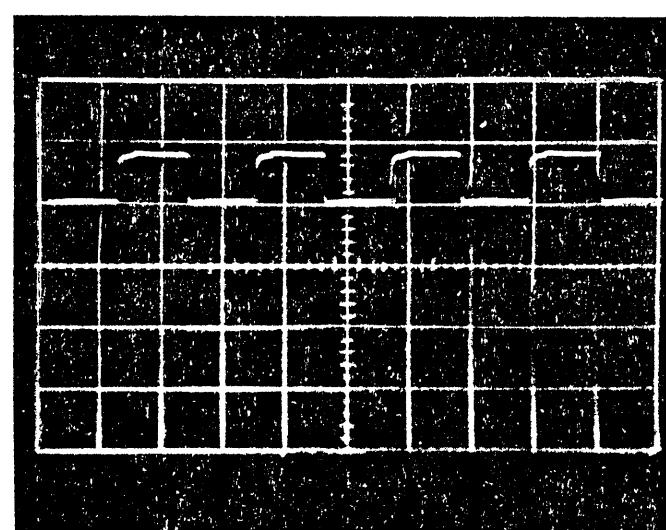

29

Oscilloscope  
connected to:-

PCB H2 Pin 1

Oscilloscope  
set to:-

1 $\mu$ s/cm

30

Y DEFLECTION SYSTEM

All measurements should be taken using an AVO. Model 8.

VOLTAGES ON PCB H1

TRANSISTOR			VOLTAGE	
			MIN	MAX
TR1	TR18	source	+ 0.1	+ 4.1
TR3	TR20	emitter	- 0.49	+ 3.49
TR7	TR24	base	+ 7.16	+ 8.44
TR7	TR24	collector	+ 6.46	+ 7.54
TR5	TR22	emitter	- 1.29	+ 2.97
TR10	TR27	collector	+ 0.6	+ 0.8
TR12	TR28	collector	+ 9.8	+10.2

TR14		base	+3.2	+5.4

\* This voltage is established by the Mean Plate Potential adjustment, see Section 4 Part 1, calibration. If it is in error, the calibration procedure should be carried out.

DISMANTLING

TO REMOVE COVERS:-

Remove four screws securing the rear cover. Remove four screws securing the bottom cover. Slacken the screws securing handle and side-trims and ease out both side covers.

PCB A:-

Release five captive screws securing the PCB and hinge forward about the cableform.

PCB B:-

Unsolder D15 from the terminal strip, R47 from pin 5, and the leads from pins 2 and 4. Release the five captive screws securing the PCB and hinge about the cableform.

PCB C:-

Unsolder the leads from pins 1, 2, 3 and 4 and from pins 21, 22 and 23. Unplug the green socket from the plug on the centre metalwork. Release the five captive screws and the PCB can be hinged towards the centre.

PCB D:-

Release the five captive screws securing the PCB which can then be pulled forward, easing it carefully past adjacent cableforms.

PCB E:-

Release the five captive screws securing the PCB and ease it carefully past adjacent cableforms. It will then hinge downwards.

PCB F:-

Unplug the five coloured sockets from the pins in the centre metal-work. Release the six captive screws securing the PCB and hinge it outwards.

PCB G:-

Unsolder the leads from pins 1 and 2. Release the two screws immediately above the PCB and also the screw at the rear left-hand corner of the Plate Selector Board. Hinge the board forward about the lower edge.

Plate Selector Board:-

First hinge forward PCB G as directed in the previous paragraph. Unplug the red and black sockets from the Y-plate pins of the CRT and hinge up the board part-way. Unplug the yellow and blue sockets from the X-plate pins of the CRT and hinge up the board to its full extent.

X Amp and Timebase Unit

Slacken the five front panel retaining screws.

Release the retaining clip and unplug the multiway connector (PL1/K) situated below the mains selector panel. Unplug the sockets (red, yellow, white, blue, black) on the top centre chassis member and the socket (green) on the bottom centre chassis member.

Release the two captive screws holding the rear of the unit to the centre chassis member, remove the five front panel securing screws. Carefully withdraw the unit.

Y Preamplifier Unit

From the bottom of the instrument, unsolder all leads from the edge of PCB H2 including the coaxial lead. Remove four screws, two from the bracket fixed to the centre partition and two from the side-member of the chassis, taking care not to drop the spacers into the instrument. Remove four screws from the corners of the front panel of the unit. Withdraw the unit.

PCB H1:-

Remove the Y preamplifier unit as above. Unsolder the two earth braids on the INVERT switch operating rods and remove the rods. Remove, without unwiring, RV7 and RV15 POSITION potentiometers and RV2 and RV9, GAIN potentiometers.

CDU150-CT531/3  
OSCILLOSCOPE

Unsolder R38 from the earth tag inside the unit and the leads from pins 18 and 19. Remove six screws securing the PCB which can then be lifted. Further leads may be unsoldered to attain the desired degree of freedom.

PCB H2:-

Remove the Y preamplifier unit as above. Remove the four corner securing screws and unsolder such leads as are necessary to achieve the desired degree of freedom.

PCB J1 & PCB J2:-

Removal of these boards entails complete dismantling of the preamplifier unit and should not be attempted.

Replacement of CRT:-

Hinge out PCB G and the Plate Selector Board (see above). Unplug the four deflector plate connectors and slacken the tube-neck clamp (if fitted) which appears through the tube screen adjacent to the Y-plate connectors. Remove the retaining stop (if fitted) from behind the tube base, and pull off the tube base taking care not to bend the tube pins. Remove the PDA connector (Red rubber) from the tube envelope just behind the front panel. Remove the bezel, graticule and filter by means of the four corner screws.

Push the tube forward from the rear and draw it out until the white twist-coil leads appear. Unsolder these and remove the tube.

Fit the new tube in the reverse order.

NOTE: The instrument will need recalibration if a new tube is fitted.  
See Section 4.

SECTION 5LAYOUTS, COMPONENT LISTS AND CIRCUIT DIAGRAMSINTRODUCTION

Circuit diagrams are drawn on a functional basis, each comprising a printed-circuit board and, in some cases, associated components mounted on one or more of the three main assemblies: Main Frame, X-amplifier and Timebase assembly, and Y-amplifier assembly. For example, the circuit diagram of the Low Voltage Power Supply Fig.5.4, consists of a printed-circuit board and a number of components on the Main Frame and on the X-amplifier and Timebase Assembly.

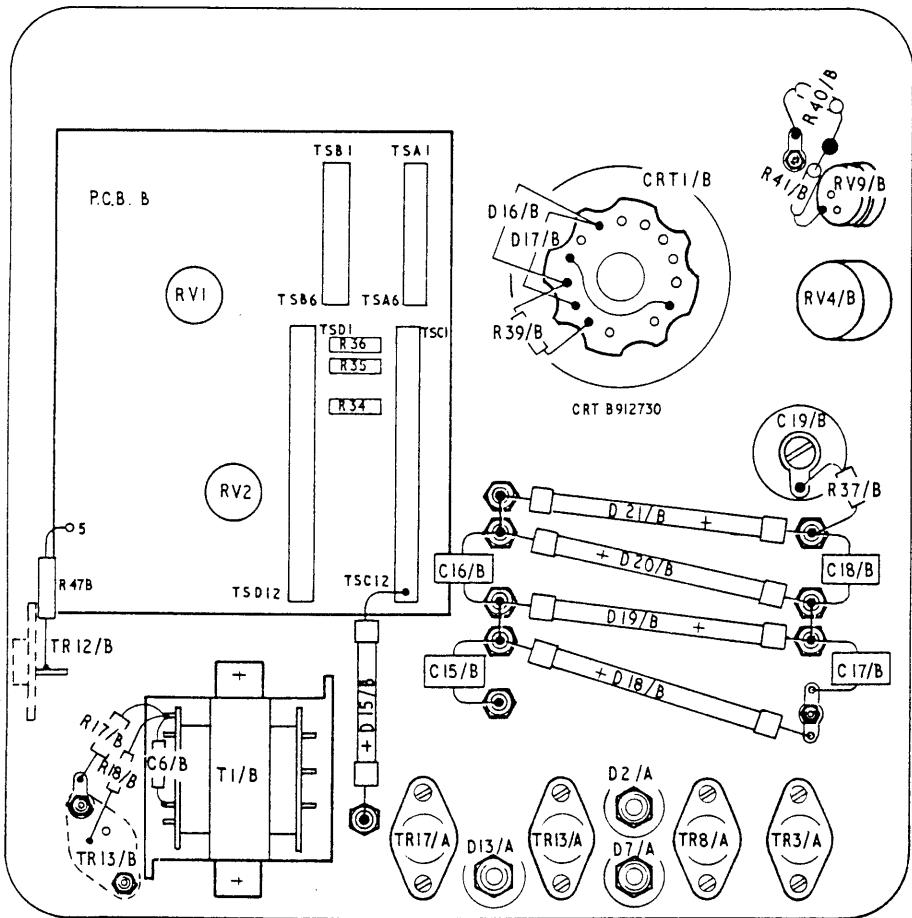

A component lists is provided for each functional circuit, given every component in the circuit diagram. A layout diagram facing the circuit diagram shows the location of components on the printed-circuit board; the location of other components is shown either on Fig.5.1 or 5.2. If the location of a component as shown on Fig.5.1 or Fig.5.2, this is indicated against the component in the component list, and the component detail is given in the component list adjacent to Fig.5.1 and Fig.5.2.

Each circuit has a reference letter, as listed on page (ii). These letters are used as a suffix to the circuit reference of those components not mounted on printed-circuit boards. The suffixes do not appear on the actual instrument.

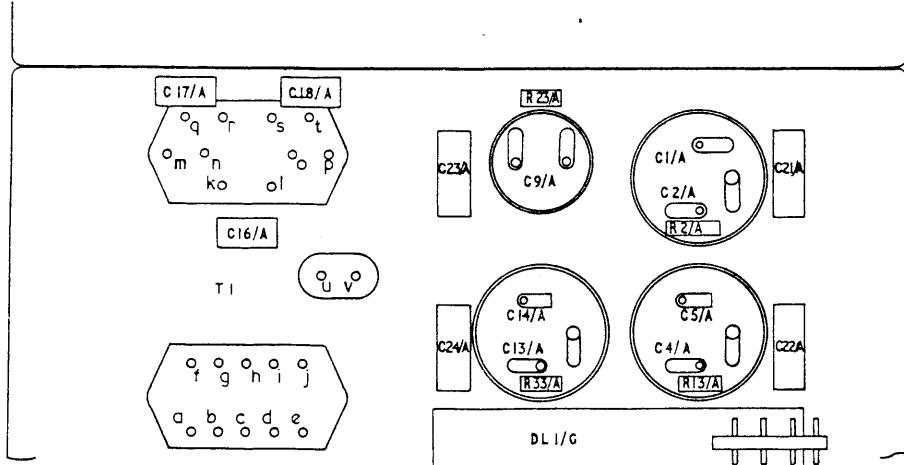

LIST OF SYMBOL USED

CC	Carbon Composition	HSP	Polystyrene
HSC	Hi Stab Carbon	P	
O	Metal Oxide	PE	Polyester
F	Metal Film	PC	Polycarbonate
W	Wirewound	M	Mica
C	Ceramic	T	Tantalum
E	Electrolytic		

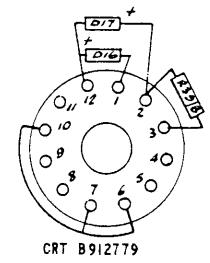

NOTE: 1. Components lists show preferred Cossor Approved components, but other approved components may have been used during production.  
 2. ONLY approved switch lubricant is Electrolube 2 GA-X.
